Title

**NITROOXYDERIVATIVES OF CARVEDILOL AND OTHER BETA BLOCKERS
AS ANTIHYPERTENSIVE DRUGS**

5 The present invention relates to β -adrenergic blockers derivatives. More particularly, the present invention relates to β -adrenergic blockers nitrooxyderivatives, pharmaceutical compositions containing them and their use for the treatment of hypertension, cardiovascular diseases, glaucoma, migraine headache, vascular diseases and elevated intraocular pressure.

10 β -adrenergic blockers (β -blockers) are widely used in the treatment of hypertension and cardiovascular diseases including angina pectoris, arrhythmias, acute myocardial infarction, hypertrophic cardiomyopathy, congestive heart failure. They work to block the effects of catecholamines at receptor sites in the heart, but they differ somewhat in their ability to block receptors in the blood vessels and lungs. Selective
15 β -blockers have their major actions on the heart, some others are weak stimulators of the β -receptor while still blocking the major actions of catecholamines, some block both the β_1 and β_2 receptors in the heart and those in the blood vessels and have no stimulatory activity and some block other catecholamine receptors that can lead to further vascular effects on blood vessels.

20 Several side effects are associated with this class of drugs such as muscle fatigue, sleep disturbances, decreased heart rate, hypotension, cold extremities, bronchospasm in asthmatic patients, hypoglycemia, increased in plasma lipids. Moreover, abrupt withdrawal after long-term treatment with β -blockers has to be avoided, because an increased sensitivity to β -adrenergic system develops

25 U.S. Pat. No. 6,242,432 discloses derivatives of formula $A-(X_1-NO_2)_{t_0}$ having an antithrombotic activity, wherein A is the residue of a β -adrenergic blocker, X_1 is a bivalent connecting bridge and t_0 is 1 or 2. The invention is limited to particular residues of β -adrenergic blockers.

30 U.S. Pat. No. 5,502,237 and U.S. Pat. No. 5,639,904 disclose derivatives of formula $R_1-Ar-O-CH_2-CH(OH)-CH_2-NH-CH(CH_3)_2$ used for the treatment of cardiovascular affections, wherein R_1 is a chain having at least one nitrooxy group as substituent.

U.S. Pat. No. 4,801,596 discloses aminopropanol derivatives of formula

that can be used for prophylaxis and/or treatment of heart and circulatory diseases, wherein R_3 is an alkyl or a nitrooxyalkyl radical containing 3 to 8 carbon atoms.

It was an object of the present invention to provide new β -adrenergic blockers nitrooxyderivatives having a significantly improved overall pharmacological profile as compared to native β -blockers that are able not only to eliminate or at least reduce the side effects associated with their parent compounds, but also having an improved pharmacological activity and tolerability.

It has been so surprisingly found that the β -adrenergic blockers nitrooxyderivatives of the present invention have a better pharmacological activity and organ protection properties, enhanced effects as anti-inflammatory, and on renal functions. In addition, they are effective in other pathologies including atherosclerosis, diabetes, peripheral vascular diseases (PVD) and elevated intraocular pressure.

In particular, it has been recognized that the β -adrenergic blockers nitrooxyderivatives of the present invention, differently from the above mentioned compounds of the prior art, exhibit an improved activity on the cardiovascular system and enhanced tolerability and can be employed for treating or preventing hypertension, cardiovascular diseases, glaucoma, migraine headache, vascular diseases and elevated intraocular pressure.

Example 8

Measurements of cGMP in rat PC12 cell line.

cGMP contributes to the function and interaction of several vascular cell types and its dysfunction is involved in major cardiovascular diseases such as hypertension, diabetic complications, atherosclerosis, and tissue infarction. Therefore the extent of cGMP formation elicited by the compounds of the inventions was evaluated in the rat pheochromocytoma (PC12) cell line.

Method

Cells were maintained at 37°C in DMEM medium enriched with 10% horse serum and 5% foetal bovine serum under 5% CO₂ atmosphere. At the time of experiments the cells were washed once with Hank's Balanced Salt Solution (HBSS) supplemented with 0.05% ascorbic acid and preincubated in the same buffer for 10 min in a floating water bath. After the preincubation step, cells were exposed for additional 45 min to either control conditions or increasing concentrations of test compounds ranging from 0.1 to 25 µM, in the presence of the phosphodiesterase inhibitor, IBMX (100 µM) and the NO-independent activator of soluble guanylyl cyclase, YC-1 (20 µM). The reaction was terminated by the removal of the incubating buffer and consecutive addition of 100 µl of absolute ethanol. The organic extracts were then evaporated to dryness and the residues dissolved in aqueous buffer for quantitative determination of intracellular cGMP levels using the cGMP enzyme immunoassay kit.

The obtained results reported in Table 1 are expressed as EC₅₀ (µM) and efficacy E_{max} (% of vehicle). As shown in the table the nitroderivatives of carvedilol induced a consistent increase of intracellular cGMP formation in PC12 cell line. Conversely, this effect was not induced by the parent compound.
